Coaching display guide

Version 31 · DRAFT. Numbered items are screen text; indented paragraphs are their optional Guide me guidance. Questions and tries are separate choices, not paired activities.

Start. From the Classic compass, tap the centre, then Coaching. Choose Progress, Stuck, Unclear, Explore, AI or Team. An opener is optional: tap the Coaching compass centre, then Another opener.

Controls. Paths changes context. Another cycles within the current path and question/try type. Try (optional) and Question switch types; each remembers its own place. Guide me opens the current guidance; Back returns to where you came from. For an opener, use Options > Guide me.

Finishing and reminders. Release opens the closing prompts. Options > Reminders opens the listening reminders. Next cycles within either group; Opening returns to the compass. Both screens also offer Back and Release, but no Guide me. Guide offers Back, Release, Opening and Reminders.

Options. The centre of the compass, or Options on an opener, opens the menu: Back, Another opener, Guide me, Release, Classic, Instant ON/OFF, Reminders and Sound ON/OFF. Classic changes mode; Instant skips the opening animation but not its reading hold; Sound controls the optional cue.

Scrolling and motion. Scroll when Scroll for full text appears. S arms a temporary shake request; the tap does not draw a card. Accepted shakes or flips draw an opener. Coaching automatic-shake reliability remains unresolved; use touch controls when needed.

Opening questions

1. How's the project going?

If useful, explore what's working well or what's been challenging. Neither is required.

2. Where are you with the project right now?

Follow their words. They can choose any path, ask for direct help, or stop.

3. What's been the most interesting thing you've discovered?

Follow their words. They can choose any path, ask for direct help, or stop.

4. What are you hoping to accomplish today?

Follow their words. They can choose any path, ask for direct help, or stop.

5. What have you learned that surprised you?

Follow their words. They can choose any path, ask for direct help, or stop.

6. How's the team feeling about the direction you're heading?

Follow their words. They can choose any path, ask for direct help, or stop.

Progress

Questions

1. What's working well?

Make room for useful progress. Do not manufacture a problem or assume why something worked.

2. What is working well that you would like to keep?

Make room for useful progress. Do not manufacture a problem or assume why something worked.

3. What's surprised you about your progress?

Make room for useful progress. Do not manufacture a problem or assume why something worked.

4. What would you like to build on next?

Make room for useful progress. Do not manufacture a problem or assume why something worked.

Tries

1. Would it help to try one successful approach in another example?

Make room for useful progress. Do not manufacture a problem or assume why something worked. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

2. Would it help to invite AI to challenge an assumption, then check any consequential claim against actual evidence?

Make room for useful progress. Do not manufacture a problem or assume why something worked. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

3. Would it help to identify one observation that could increase or decrease your confidence in the result?

Make room for useful progress. Do not manufacture a problem or assume why something worked. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

Stuck

Questions

1. What have you tried so far?

Understand expected and actual results before proposing a fix. Requested direct assistance is welcome; do not withhold it to prolong questioning.

2. What did you expect to happen, and what happened instead?

Understand expected and actual results before proposing a fix. Requested direct assistance is welcome; do not withhold it to prolong questioning.

3. What's been the hardest part to move past?

Understand expected and actual results before proposing a fix. Requested direct assistance is welcome; do not withhold it to prolong questioning.

4. What might you be assuming that hasn't been tested?

Understand expected and actual results before proposing a fix. Requested direct assistance is welcome; do not withhold it to prolong questioning.

Tries

1. Would a small, safe test help you learn more?

Test one reversible step, if wanted: compare expected and actual results. If mistakes could harm people or real work, use a copy or mock-up; stop before those effects. One result informs only that step. Give requested direct help; adapt, decline or continue human-only. AI/tools may check observations; AI self-critique is not proof. Match evidence to consequences, not exhaustive human re-auditing.

2. Would it help to explore contrasting approaches, with or without AI, before choosing a small step?

Understand expected and actual results before proposing a fix. Requested direct assistance is welcome; do not withhold it to prolong questioning. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

3. Would it help to test one assumption with a quick, reversible example?

Understand expected and actual results before proposing a fix. Requested direct assistance is welcome; do not withhold it to prolong questioning. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

Unclear

Questions

1. What are you hoping to accomplish?

Let them define success and what is uncertain. Do not pick a solution for them.

2. What part of the problem is still unclear?

Let them define success and what is uncertain. Do not pick a solution for them.

3. Who would benefit from solving this, and how?

Let them define success and what is uncertain. Do not pick a solution for them.

4. What would you need to learn before deciding what to do?

Let them define success and what is uncertain. Do not pick a solution for them.

Tries

1. Would it help to write a one-sentence problem statement?

Let them define success and what is uncertain. Do not pick a solution for them. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

2. Would it help to identify missing information or ambiguous requirements, with AI if useful?

Let them define success and what is uncertain. Do not pick a solution for them. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

3. Would it help to compare two possible definitions of success without choosing a solution yet?

Let them define success and what is uncertain. Do not pick a solution for them. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

Exploring

Questions

1. Which possibility would you like to explore?

Explore differences without forcing a winner. Keeping a human-only approach is a complete choice.

2. What different approaches have you considered?

Explore differences without forcing a winner. Keeping a human-only approach is a complete choice.

3. What might you learn by trying something different?

Explore differences without forcing a winner. Keeping a human-only approach is a complete choice.

4. What would help you choose between these ideas?

Explore differences without forcing a winner. Keeping a human-only approach is a complete choice.

Tries

1. Would it help to sketch a human-only approach?

Sketch, say or draw one feasible human-only step; that is a complete choice. Only if useful, compare realistic human-only, AI-assisted and hybrid routes: preparation, work, checking, correction, integration and learning and capability. No winner or AI trial is required. Adapt, decline or request direct help. AI/tools may check feasibility against sources or observations; AI self-critique is not proof. Match evidence to consequences, not exhaustive human re-auditing.

2. Would it help to compare two ideas in a small, safe test?

Explore differences without forcing a winner. Keeping a human-only approach is a complete choice. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

3. Would it help to explore an argument against the current favorite, without needing to change your mind?

Explore differences without forcing a winner. Keeping a human-only approach is a complete choice. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

AI Results

Questions

1. How well does the output fit what you need?

Understand expected versus actual results before changing prompts. The goal, context, data, tool limits or choice to use AI may matter. Only if they report disappointing output, you could ask: What part felt least useful?

2. How does the output compare with what you expected?

Understand expected versus actual results before changing prompts. The goal, context, data, tool limits or choice to use AI may matter. Only if they report disappointing output, you could ask: What part felt least useful?

3. What makes this example useful for what you want to do?

Understand expected versus actual results before changing prompts. The goal, context, data, tool limits or choice to use AI may matter. Only if they report disappointing output, you could ask: What part felt least useful?

4. What have you learned from the approaches you've already tried?

Understand expected versus actual results before changing prompts. The goal, context, data, tool limits or choice to use AI may matter. Only if they report disappointing output, you could ask: What part felt least useful?

Tries

1. Would it help to ask AI to critique the output against your goal, then test consequential claims using sources, observations or executable checks?

Understand expected versus actual results before changing prompts. The goal, context, data, tool limits or choice to use AI may matter. Only if they report disappointing output, you could ask: What part felt least useful? This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

2. Would it help to check one claim together?

Compare expectations and output; consider goal, context, data, tool limits or choosing AI. Only if disappointing, ask what felt least useful. If wanted, check one consequential claim against original sources, executed checks or observations; AI/tools can help. Missing evidence leaves uncertainty. Adapt, decline, request direct help or continue human-only. AI self-critique is not proof. Match evidence to consequences, not exhaustive human re-auditing.

3. Would it help to choose a few useful criteria and compare outputs against them?

Understand expected versus actual results before changing prompts. The goal, context, data, tool limits or choice to use AI may matter. Only if they report disappointing output, you could ask: What part felt least useful? This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

Team

Questions

1. How is working together going for you?

Differences can remain visible. Do not invent agreement or diagnose silence. Offer passing, writing, drawing, spoken or paired alternatives; sharing is optional.

2. Where do you see things differently?

Differences can remain visible. Do not invent agreement or diagnose silence. Offer passing, writing, drawing, spoken or paired alternatives; sharing is optional.

3. Are there perspectives we haven't heard yet?

Differences can remain visible. Do not invent agreement or diagnose silence. Offer passing, writing, drawing, spoken or paired alternatives; sharing is optional.

4. From your perspective, what matters most right now?

Differences can remain visible. Do not invent agreement or diagnose silence. Offer passing, writing, drawing, spoken or paired alternatives; sharing is optional.

Tries

1. Would a quiet minute before sharing help?

Listen for differences; do not diagnose silence or infer agreement from silence or sharing. Quiet thinking, writing or drawing is optional; offer spoken or paired alternatives. Passing needs no explanation. Sharing is voluntary; nothing needs collecting. Adapt, decline, request direct help or continue human-only. If checking a shared claim, AI/tools may use sources or observations; AI self-critique is not proof. Match evidence to consequences, not exhaustive human re-auditing.

2. Would it help to privately write, draw or discuss an uncertainty in pairs, then optionally share differences?

Differences can remain visible. Do not invent agreement or diagnose silence. Offer passing, writing, drawing, spoken or paired alternatives; sharing is optional. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

3. Would it help to look for a small experiment people understand, leaving disagreements visible rather than assuming agreement?

Differences can remain visible. Do not invent agreement or diagnose silence. Offer passing, writing, drawing, spoken or paired alternatives; sharing is optional. This is optional: adapt, decline, request direct help, or choose another next step. AI self-critique is not proof; use evidence suited to the consequence, not exhaustive human auditing.

Closing prompts

1. What's your next step?

2. What would you like to try first?

3. How will you know whether that helped?

Listening reminders

1. Stay curious. Listen before solving. Follow their words, not your assumptions.

2. Silence can be thinking time; do not diagnose it. Offer direct assistance when requested.

3. Passing, writing, drawing, speaking or pairs are legitimate choices. Let people own their next step.

4. Invite a brief round without interruptions. State that passing is welcome and private or paired contributions are alternatives. Reflect back ideas without attaching judgments to who spoke or stayed quiet.
